

## Oligopoly

---

---

---

---

---

---

---

---

## Cournot

- n firms, each maximizing

$$\pi_i = p(Q)q_i - c_i(q_i)$$

$$0 = \frac{\partial \pi_i}{\partial q_i} = p(Q) + p'(Q)q_i - c'_i(q_i)$$

---

---

---

---

---

---

---

---

## Implications of FOCs

- Shares  $s_i = \frac{q_i}{Q}$

$$\frac{p(Q) - c'_i(q_i)}{p(Q)} = -\frac{p'(Q)q_i}{p(Q)} = -\frac{Qp'(Q)q_i}{p(Q)Q} = \frac{s_i}{\varepsilon}$$

- Hirschman Herfindahl Index

$$\sum_{i=1}^n \frac{p(Q) - c'_i(q_i)}{p(Q)} s_i = \frac{1}{\varepsilon} \sum_{i=1}^n s_i^2 = \frac{HHI}{\varepsilon}$$

$$HHI = \sum_{i=1}^n s_i^2$$

---

---

---

---

---

---

---

---

## Cournot

- Represents a tractable intermediate case between monopoly and competition
- Fixed costs can be used to generate the number of firms
- Widely used in antitrust analysis

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Price Dispersion

- Failure of law of one price
- Groceries, airline tickets, etc. have high variation
- Theory attributes to informational or search differences

---

---

---

---

---

---

---

---

## Theory

- Each consumer buys one unit
- Max price  $p_m$
- $s$  are shoppers, seek best price
- $1-s$  buy from one of  $n$  firms (loyal)
- $MC = c$
- No pure strategy equilibrium exists
  - either beat low price firm or charge 1

---

---

---

---

---

---

---

---

## Mixed Strategy Equilibrium

- Seek distribution  $F$  of prices
- Given others randomize over  $F$ , profits are

$$\pi(p) = (p - c) \left( \frac{1-s}{n} + s(1-F(p))^{n-1} \right)$$

- Profits are constant to induce randomization

$$\pi(p) = (p - c) \left( \frac{1-s}{n} + s(1-F(p))^{n-1} \right) = (p_m - c) \frac{1-s}{n}$$

---

---

---

---

---

---

---

---

## Solution

- Firm randomizes with distribution  $F$  over the interval  $[L, p_m]$  and

$$F(p) = \left( 1 - \frac{(p_m - p)(1-s)}{s(p-c)n} \right)^{\frac{1}{n-1}}$$

$$L = c + \frac{(p_m - c) \frac{1-s}{n}}{\frac{1-s}{n} + s}$$

---

---

---

---

---

---

---

---

# I

$$n\pi(p) = (p_m - c)(1 - s).$$

- Profits Depend on number of non shoppers

---

---

---

---

---

---

---

---

## Industry Performance

- Profits Depend on number of non-shoppers  
 $n\pi(p) = (p_m - c)(1 - s).$
- Shoppers convey a positive externality to the non-shoppers
- Non-shoppers convey a negative externality on shoppers

---

---

---

---

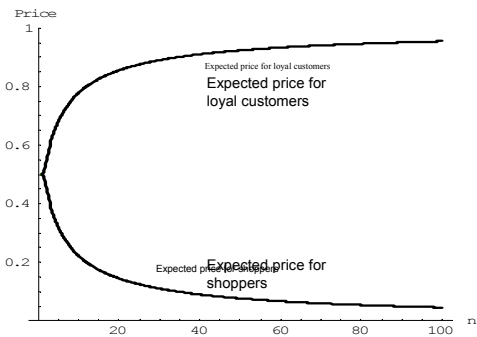

---

---

---

---

## Prices

---

---

---

---

---

---

---

---

## External Effect of Shoppers

---

---

---

---

---

---

---

---

## Predictions

- Unpredictable prices
  - Grocery prices vary week to week
  - 50% price changes common
- Closed form for price distribution
  - Readily tested
- Negative correlation over time
  - Low prices build up consumer inventories
  - High consumer inventories induce high prices

---

---

---

---

---

---

---

---

## Hotelling Line

- Products are viewed as located on a line
- Same line represents preferences of consumers

---

---

---

---

---

---

---

---

## Types

- Quality ("vertical differentiation")
  - gas mileage
  - reliability
  - durability
- Variety ("horizontal differentiation")
  - color
  - style

---

---

---

---

---

---

---

---

## Circle Model

- $1/n$  locations on unit circle
- transport cost  $t$  per unit
- Consumers minimize cost of purchase plus transport

---

---

---

---

---

---

---

---

## Determination of Prices

---

---

---

---

---

---

---

---

## Equilibrium Price

- Suppose all firms but one charge  $p^*$
- Remaining firm charges  $r$ .
- Equilibrium if profit-maximizing  $r = p$ .
- Consumer who is indifferent is distance  $x^*$
- $r + tx^* = p + t(1/n - x^*)$

$$x^* = \frac{p + \frac{t}{n} - r}{2t} = \frac{1}{2n} + \frac{p - r}{2t}$$

---

---

---

---

---

---

---

---

## Profit Maximization

- Profit is  $(r - c)2x^* = (r - c)\left(\frac{1}{n} + \frac{p - r}{t}\right)$

- Maximized at

$$0 = \frac{\partial}{\partial r} (r - c)\left(\frac{1}{n} + \frac{p - r}{t}\right) = \left(\frac{1}{n} + \frac{p - r}{t}\right) - \frac{r - c}{t}$$

- Equilibrium  $p = r \Rightarrow p = c + \frac{t}{n}$ .

---

---

---

---

---

---

---

---

## Profits and Efficiency

- Profits are  $\frac{t}{n^2}$

- Entry cost  $F$  yields  $n = \sqrt{t/F}$ .

- Total cost of delivery is  $\frac{t}{4n} + nF$

- Efficient number of firms is  $n^* = \frac{1}{2}\sqrt{t/F}$

- Too many firms!

---

---

---

---

---

---

---

---

## Agency Theory

- Firm sets commission  $s$ , salary  $y$ .
- Agent obtains

$$u = sx + y - \frac{x^2}{2a} - s\lambda\sigma^2$$

- Where  $x$  is the effort in output units,  $1/a$  measures the disutility of effort,  $\sigma^2$  is the risk, and  $\lambda$  is the risk premium.

---

---

---

---

---

---

---

---

## Agent Maximization

- A working agent maximizes  $u$  over effort  $x$ , which yields  $x=sa$ .
- Increasing shares increase effort.
- Salary  $y$  is set to insure the agent accepts the job ( $u_0$  is the reservation utility level):

$$u_0 = s^2a + y - \frac{(sa)^2}{2a} - s\lambda\sigma^2 = y + \frac{1}{2}s^2a - s\lambda\sigma^2$$

---

---

---

---

---

---

---

---

## Salary Determination

- This gives:  $y = u_0 - \frac{1}{2}s^2a + s\lambda\sigma^2$
- The salary must be higher to compensate for increased risk.

---

---

---

---

---

---

---

---

## Firm Profits

- The firm earns

$$\begin{aligned}\pi &= (1-s)x - y \\ &= (1-s)sa - (u_0 - \frac{1}{2}s^2a + s\lambda\sigma^2) \\ &= sa - u_0 - \frac{1}{2}s^2a - s\lambda\sigma^2\end{aligned}$$

- This provides the firm with the output, minus the cost of effort, the cost of the agent, and the cost of risk.

---

---

---

---

---

---

---

---

## Firm Maximization

- The firm chooses the agent's share  $s$

$$s = 1 - \frac{\lambda}{a}\sigma^2$$

- The share increases in the ability  $1/a$  of the agent, and decreases in the riskiness or cost of risk.

---

---

---

---

---

---

---

---

## Selection of Agent

- Agent paid with a combination of salary and commission
- With a fixed salary, more able agents obtain a higher return.
- Thus, offering a higher commission, lower salary will attract more able agents.
- RE/MAX
- Incentives aren't just about effort, but about agent selection as well

---

---

---

---

---

---

---

---
